

FRODO

A Framework for Distributed Organizational Memories

Andreas Dengel, Ansgar Bernardi
Andreas Abecker, Ludger van Elst
Markus Junker, Michael Sintek

21st SAB – Spring 2000

Agenda

FRODO

- *Motivation: from KnowMore to FRODO*

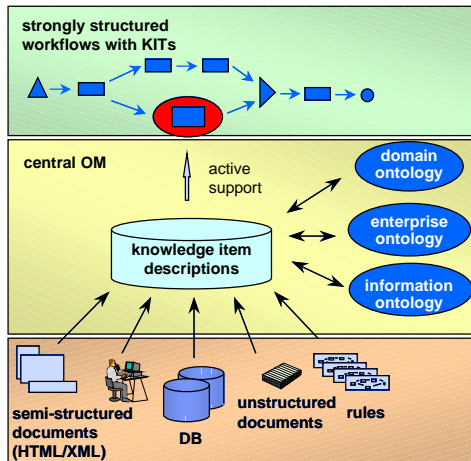

- *FRODO Research questions:*
 - 1 *Framework*
 - 2 *Ontologies*
 - 3 *DAU services for the OM*
 - 4 *Methodology for BPOKM*
 - 5 *Weak Workflow*

- *Work plan*

KnowMore: A Central OM with Proactive Information Supply

FRODO

- strongly structured workflows with extensions for knowledge-intensive tasks
- active information supply relies on workflow context information
- information retrieval by reasoning over central ontologies
- access to various information sources via formal knowledge item descriptions

Source: Knowledge Management Group

Page 3

The Networked World Requires a Distributed Approach to Organizational Memories

FRODO

KnowMore:

- distributed and heterogeneous knowledge sources
- knowledge-intensive, centralized inference
- global set of ontologies
- strong workflow as context

FRODO:

- independently introduced partial OMs with specialized ontologies
- distributed inference
- external knowledge sources with own ontologies
- weak workflow as context

Scaling up leads to a new architectural approach.

Page 4

The Decentralized OMs are Complemented by Agents for Information Input and Access

FRODO

- decentralized OMs ask for cooperating information agents
- the agent paradigm facilitates pluggable components for information extraction and text analysis
- wrappers allow access to foreign IT systems, e.g., legacy databases, XML files, ...

Page 6

The OM Framework Aims at a Sound Integration of Heterogeneous Subsystems

FRAMEWORK APPROACH

[FRODO](#)

- integration of
 - separately developed OM solutions and legacy (DB) systems
 - DAU components
- distributed problem solving
- based on
 - declarative knowledge representation
 - agents / speech acts / protocols
 - Internet-enabled: HTTP, XML, RDF, ...

The Framework Realization is Based on (Upcoming) Internet Standards

XML/RDF AND HTTP

[FRODO](#)

- FIPA-like agents communicate with XML messages
- communication via HTTP
- involved XML technologies:
 - XSLT for message transformation and information extraction
 - RDF for representing meta-information
 - RDF Schema for representing ontologies
 - XML/RDF-based query and transformation languages for distributed inferences
- first prototypical realization of an RDF/RDF Schema query agent (based on an F-Logic implementation for RDF: SiLRI, Karlsruhe / Stanford)
- W3C membership under consideration

Agents Communicate Via XML Messages

FRODO

```
<message type="message-type"
  sender="sender-url"
  receiver="receiver-url"
  additional-information >
  contents
</message>
```

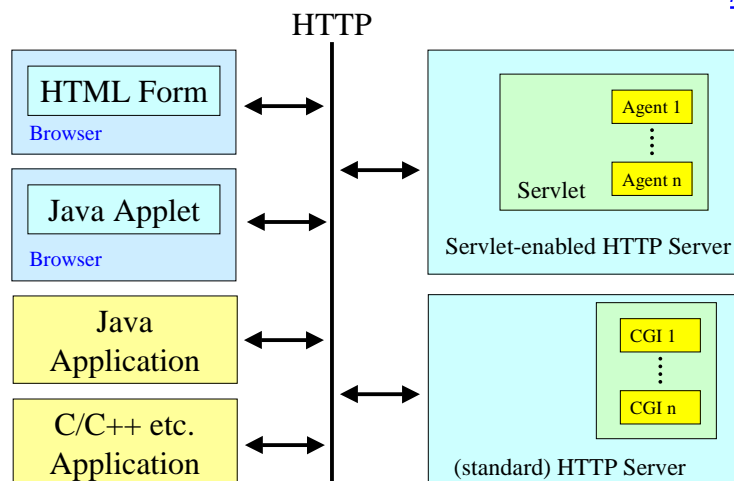

- *message types*: inform, request, agree, cancel, confirm, disconfirm, subscribe, ... (speech acts, FIPA)
- *additional information*: reply-with, in-reply-to, language, ontology, reply-by, protocol, ...
- *contents*: XML "forest"
- cooperation with the DAML initiative (DARPA, Jim Hendler) planned

Message Exchange is Based on Internet Techniques

FRODO

Our Agent Platform Enables a Simple Integration of Foreign Software Components

CONSEQUENCES

FRODO

- all foreign software components which are designed as CGI programs are immediately usable as agents (no explicit wrappers needed)
- access to agents simple for all software components that have access to a HTTP library (Java, C, C++, ...)

Higher level functionalities will be realized on this technical basis.

Page 12

FRODO Aims At an OM Middleware

FRODO

- higher-level functionalities are realized by collaborative problem-solving, e.g.:
 - cooperative information retrieval
 - knowledge fusion from different sources
 - collaborative filtering by comparison of several user profiles
- collaborative problem solving will be enabled by:
 - specific speech acts & knowledge representation if required
 - protocols / transactions
 - identification of standard agents / agent communities

Ontologies are vital for communication and collaboration.

Research Topic 2: Domain Ontologies

FRODO

Source: Knowledge Management Group

Page 14

Acquisition and Maintenance of Domain Ontologies is Hard

BUILDING DOMAIN ONTOLOGIES

[FRODO](#)

- in *KnowMore*, we sketched semi-automatic ontology acquisition exploiting *statistic* text analysis techniques
- in *FRODO*, we will couple
 - a widespread, state-of-the-art manual ontology modeling tool
 - *symbolic machine learning* for ontology acquisition
 - learning from user interaction

Ontology representation has already been investigated.

Source: Knowledge Management Group

Page 15

Use of RDF Schema Facilitates Ontology Sharing

[FRODO](#)

- RDF / RDF Schema
 - future standard (ontologies and tools can be shared/reused)
 - extensible
- Tool support: Protégé-2000/RDF
 - close cooperation with Stanford Medical Informatics
 - open source
 - extensible
 - other tools will soon be available

Manual ontology modeling will be supported by automatic knowledge acquisition from texts.

Page 16

Information Extraction Will be Employed for Ontology Modeling Support

INFORMATION EXTRACTION FOR LEARNING ONTOLOGIES

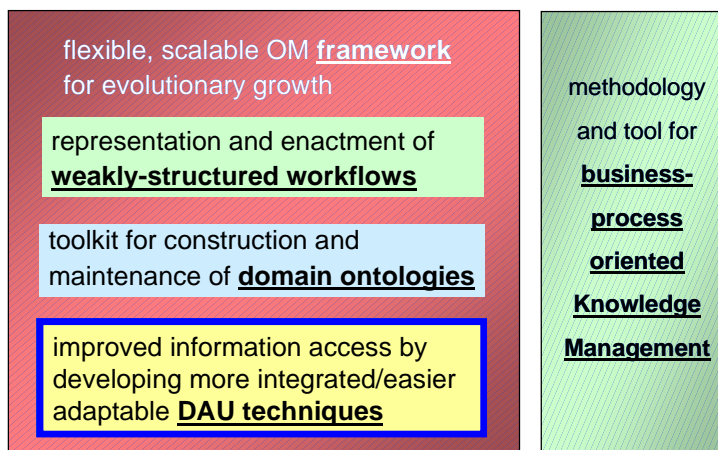

FRODO

Research Topic 3: DAU Techniques

FRODO

DAU Specialists Provide Essential Services in the OM Scenario

DAU SERVICES AND IMPROVEMENTS

FRODO

- The overall OM goal is to satisfy users' situation-specific information needs
- DAU techniques:
 - **classify** documents with respect to formal ontologies,
 - **extract** data and information from texts
- Scientific topics include:
 - use of background knowledge from the overall OM scenario:
 - domain ontologies
 - (open) processes
 - user profiles
 - ...
 - processing of structured (HTML/XML) documents

Source: Knowledge Management Group

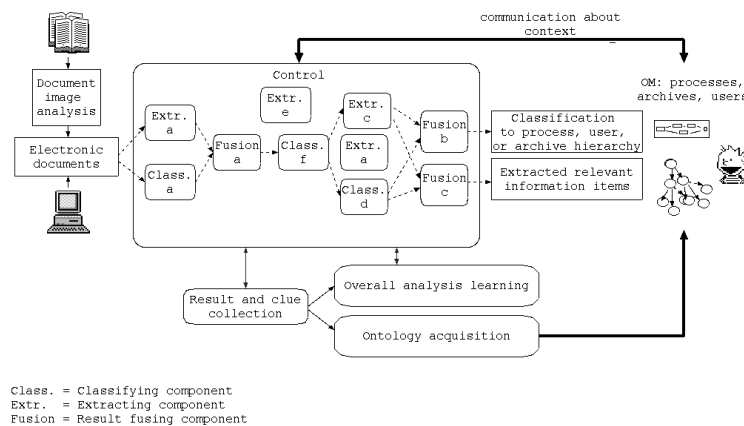

Page 19

We Will Identify Elementary Building Blocks and Control Mechanisms for DAU

FURTHER DAU RESEARCH

FRODO

Page 20

Research Topics 4 & 5: Business Process Orientation

FRODO

FRODO's Knowledge Management is Oriented Towards Business Processes

FRODO

- business processes constitute the context for active situation-specific retrieval and task-specific archiving
- business process oriented knowledge management requires:
 - a systematic approach for introduction and evolution of OM solutions with appropriate modeling support
 - a suitable notion of processes beyond the limitations of strict workflow

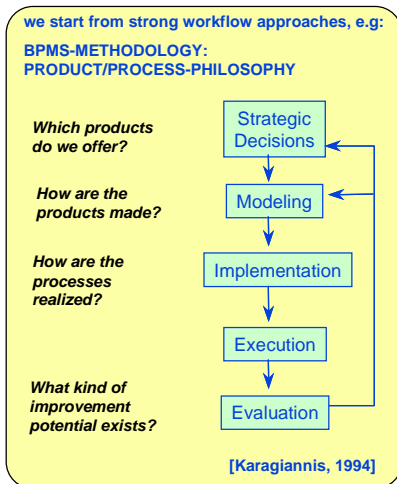

The Methodology Shall Result in a ,Handbook for OM Introduction ‘

BUSINESS PROCESS ORIENTED KNOWLEDGE MANAGEMENT

FRODO

Initial phase:

- OM-relevant entities and relationships in a company: who, where, why, what ...
- introduction guidelines:
 - identify suitable pilots
 - structure/evaluate knowledge sources
 - find communication streams
 - determine partial process models
 - ...

Iterative refinement:

- interleaved planning and execution of weakly-structured, interdependent activities and their knowledge needs

Source: Knowledge Management Group

Page 23

The Methodology Will be Equipped With an Appropriate Modeling Tool

FRODO

- modeling tasks:
 - business processes & information needs / flow
 - ontologies & knowledge item descriptions
- we will consider:
 - business process modeling (ARIS, ADONIS; UML)
 - machine learning for business process acquisition
 - integrated product and process modeling (bmb+f Verbundprojekt GiPP)
 - agent modeling
 - knowledge/ontological engineering (Protégé, KADS organizational model, ...)

The integrated modeling approach shall be based on standard techniques but must be extended for weak workflows.

Source: Knowledge Management Group

Page 24

Weakly-Structured Workflow Will Serve as *FRODO*'s OM Task Level

[FRODO](#)

- knowledge-intensive activities are seldom adequately represented by strictly formalized workflows
- weak workflow characteristics:
 - workflow control not completely predetermined
 - interleaved modeling/refinement and execution
- approach:
 - consider ad-hoc workflow, flexible workflow configuration
 - declarative formalism: logic-based, agent-based
 - open question: how can the *KnowMore* notion of context (based on strong workflow models) be transferred to the weak workflow scenario

Core Research Areas of *FRODO*

[FRODO](#)

SUMMARY

- specialized speech acts, protocols, and standard agents for business-process oriented knowledge management
- distributed / networked knowledge representation
- domain ontology acquisition based on learning from texts and user interaction
- DAU techniques (classification / information extraction) for structured documents & with background knowledge
- declarative representation and enactment of weakly-structured workflows
