
Discovering, Visualizing and Sharing Knowledge through Personalized Learning Knowledge Maps

The AWAKE Project

Jasminko Novak,
Michael Wurst

Context and Challenge

Support for heterogeneous expert communities

Discovering connections across different domains

Exchange of knowledge between individual experts

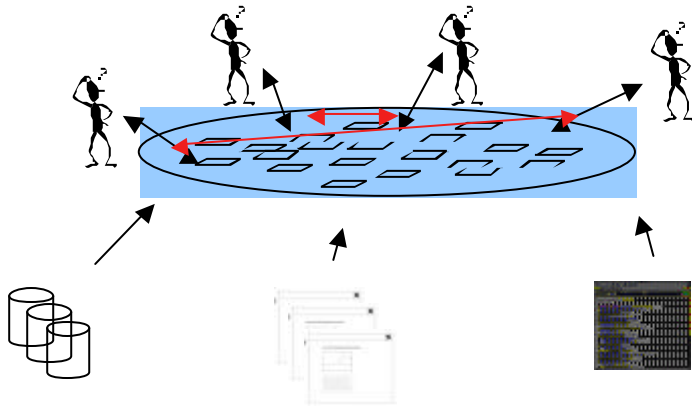

Challenge:

Capture, visualize and exchange existing knowledge of user groups

Practical Approach

Situation: Group of users explores an information space

Goal: Capture user knowledge reflected in their interaction with information

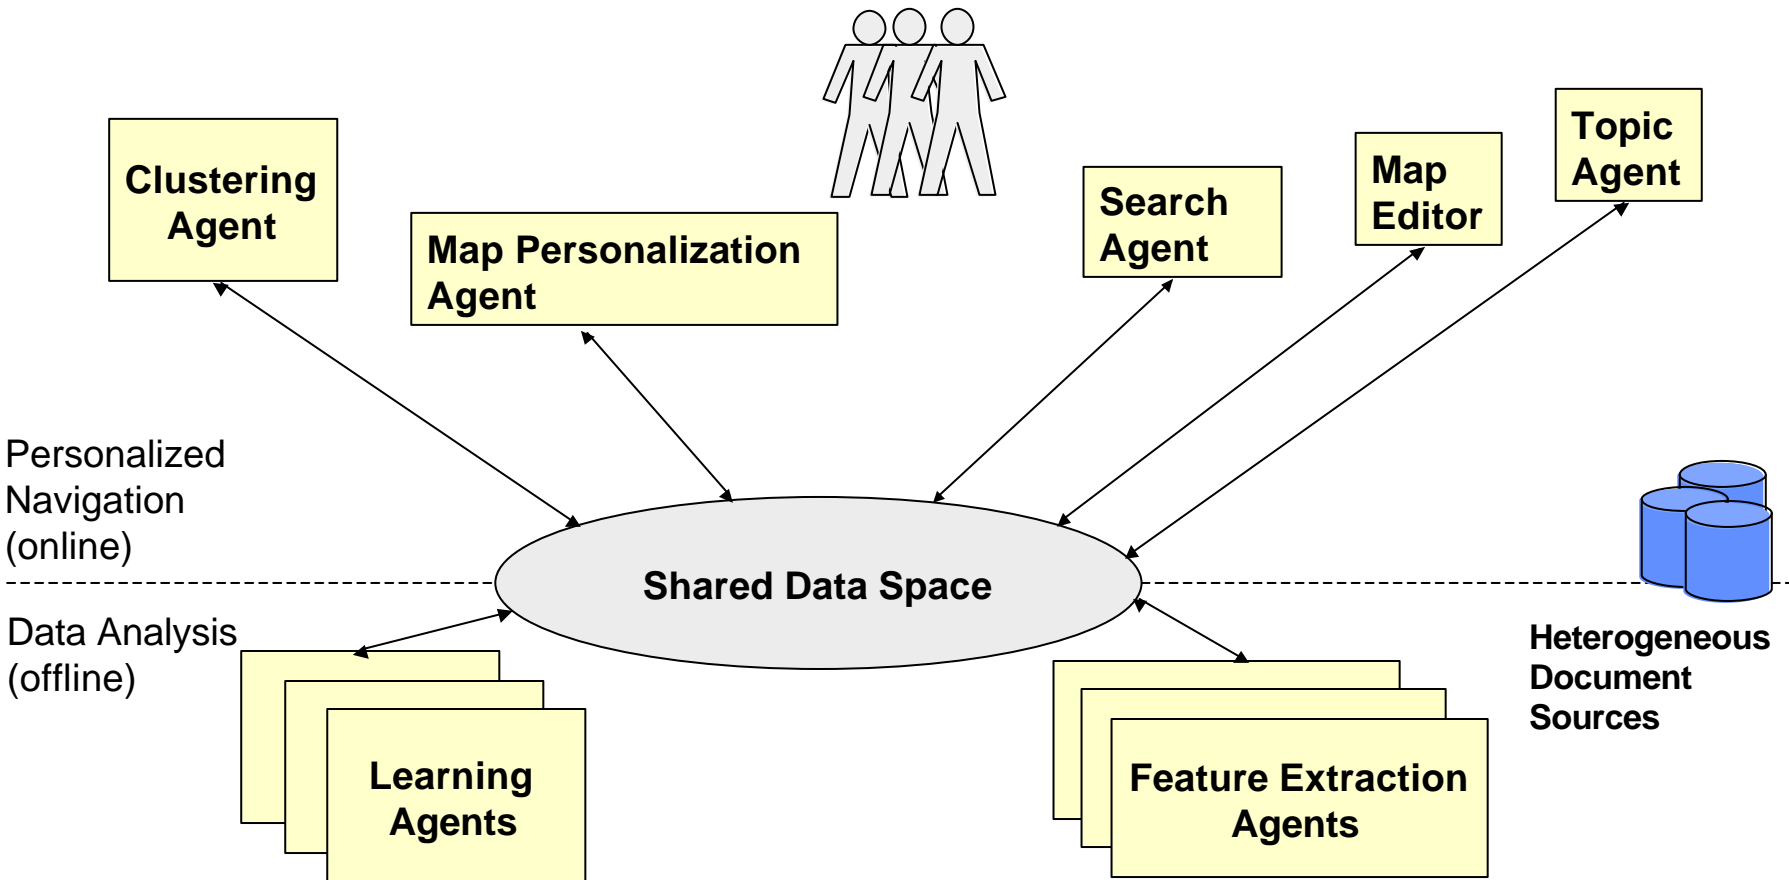

- 1) Creating a context for the interpretation of users' structuring actions
- 2) Acquisition and visualization of similarity relations between users, documents and topics

Knowledge Maps

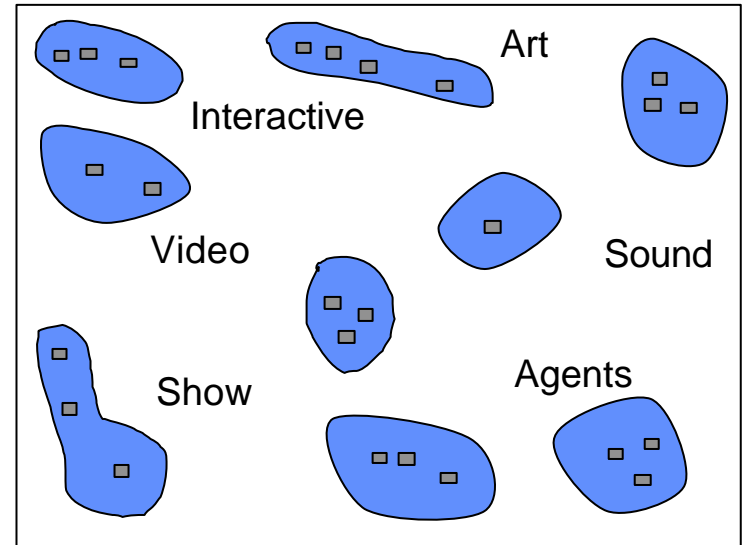

Agent Architecture

Personal Agents

System generated Knowledge Maps

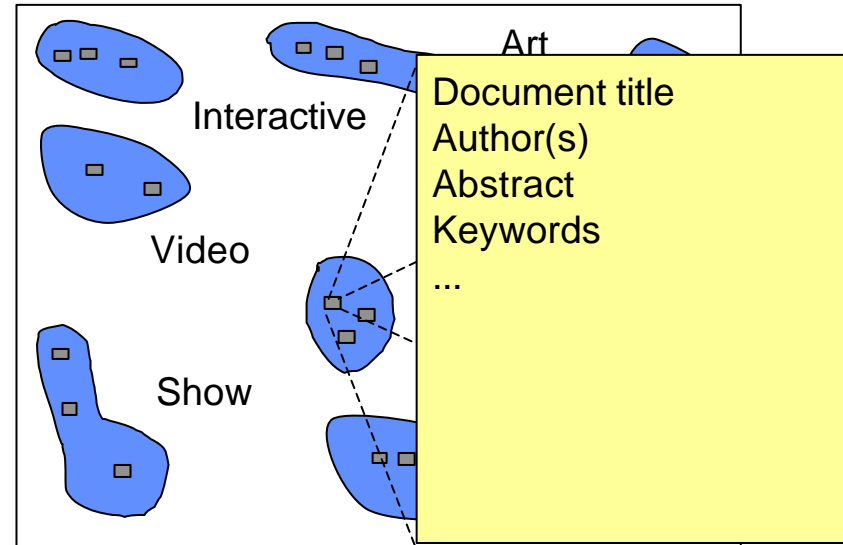

- System generated Knowledge Maps
- Detailed document information
- Related (similar) documents
- Personal Map Editor
- Search for Personal Maps
- Document pool personalization
- Topic network

Personal Agents

- Detailed document information
- Related (similar) documents
- Personal Map Editor
- Search for Personal Maps
- Document pool personalization
- Topic network

Personal Agents

Creating a Collaborative Topic Net

- System generated Knowledge Maps
- Detailed document information
- Related (similar) documents
- Personal Map Editor
- Search for Personal Maps
- Document pool personalization
- Topic network

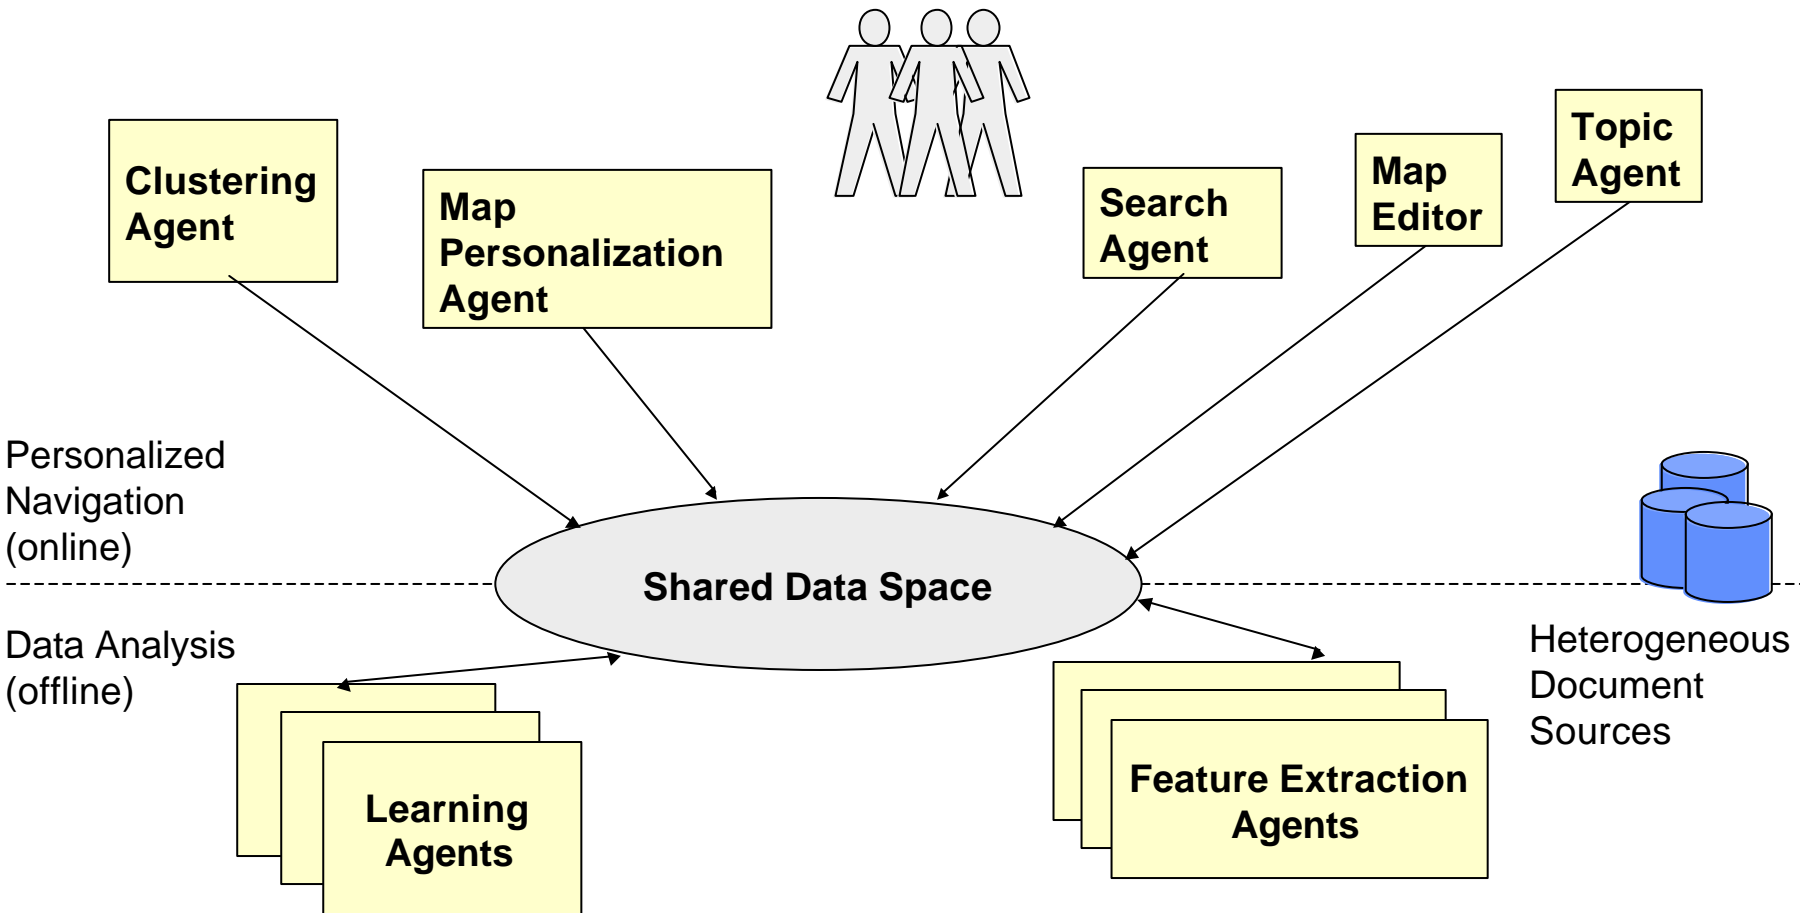

Personal Agents

The image displays a complex interface for managing personal agents. It is divided into several main sections:

- Top Left (Network Diagram):** A graph titled "cast01" showing a network of nodes and connections. Nodes include "cast01", "DIE-3D", "state", "stream", "program", "interact", "etc.", "multi-media in E.", "business of Co.", "motion", "balancing indiv...", "drawing st...", "multi-screens", "multi-user", "interactive TV", "morphological", "body", "cultural reference", and "Nonlinear story (story eng)".
- Top Right (Search Panel):** A panel titled "FIGURE / art cast01" showing search results. It includes a "Project Title" section with "(RhythmEngine)", a description of the project as a spatial communication interface, and a list of "Keywords" including "Rhythm Engine", "Multi-Screens", and "Interactive TV".
- Bottom Left (Network Diagram):** A smaller network diagram titled "test1 cast01" showing a simplified version of the network with nodes like "interact", "balancing indiv...", "motion", "multi-screens", "multi-user", "interactive TV", "morphological", "body", "cultural reference", and "Nonlinear story (story eng)".
- Bottom Right (Search Panel):** A smaller search panel titled "test1 cast01" showing search results for the test network.

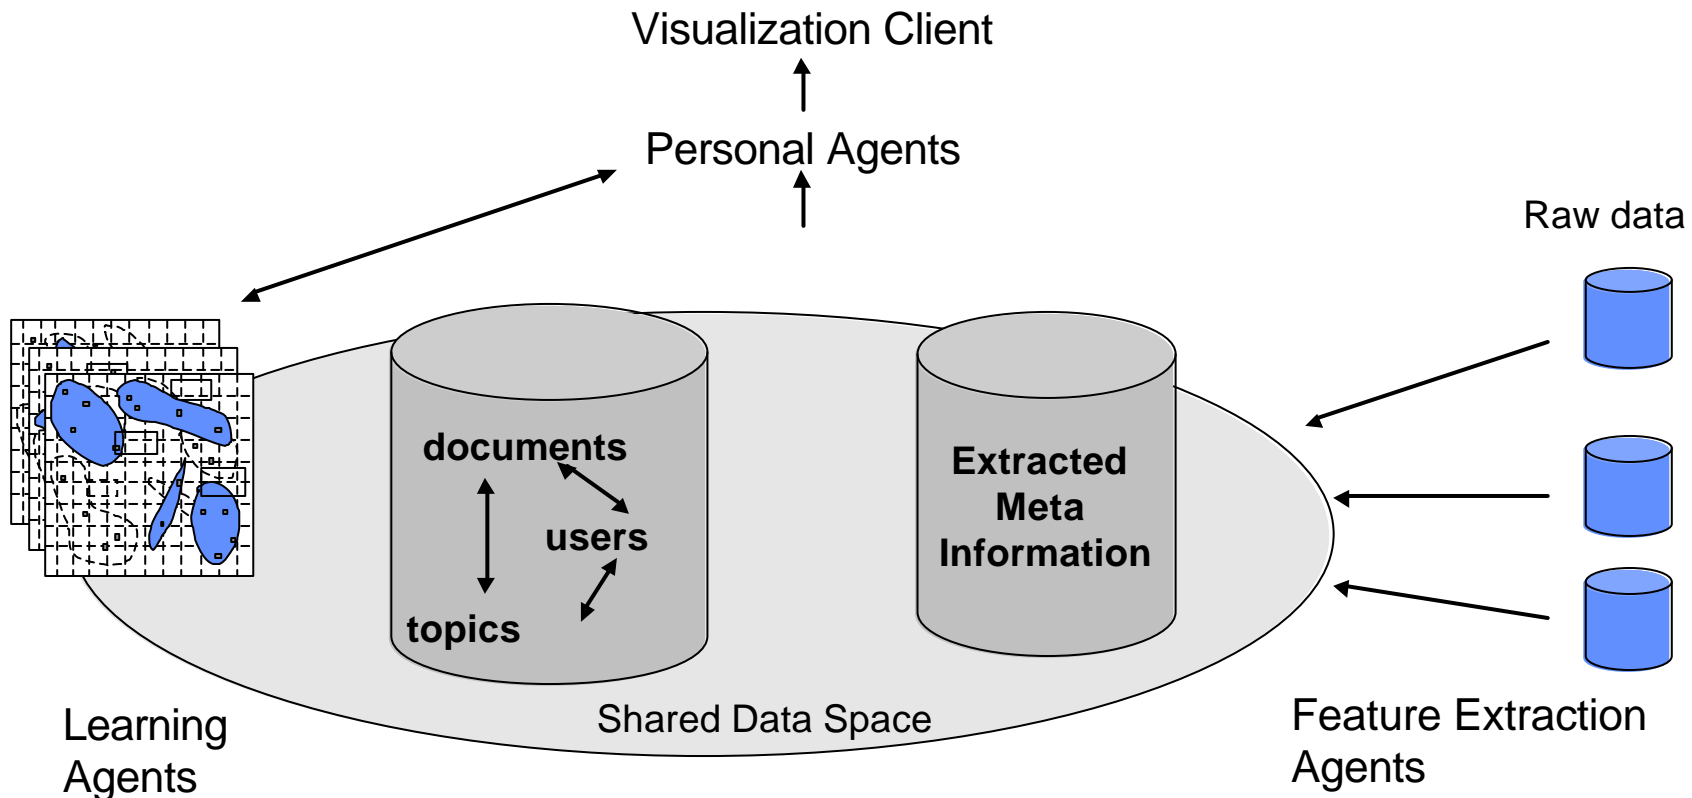

At the bottom of each diagram, there are checkboxes for "Textanalyse", "Keywords", "Title", and "Typical Member", along with a zoom level indicator (e.g., "95%", "133%", "143%").

Agent Architecture

Shared Data Space

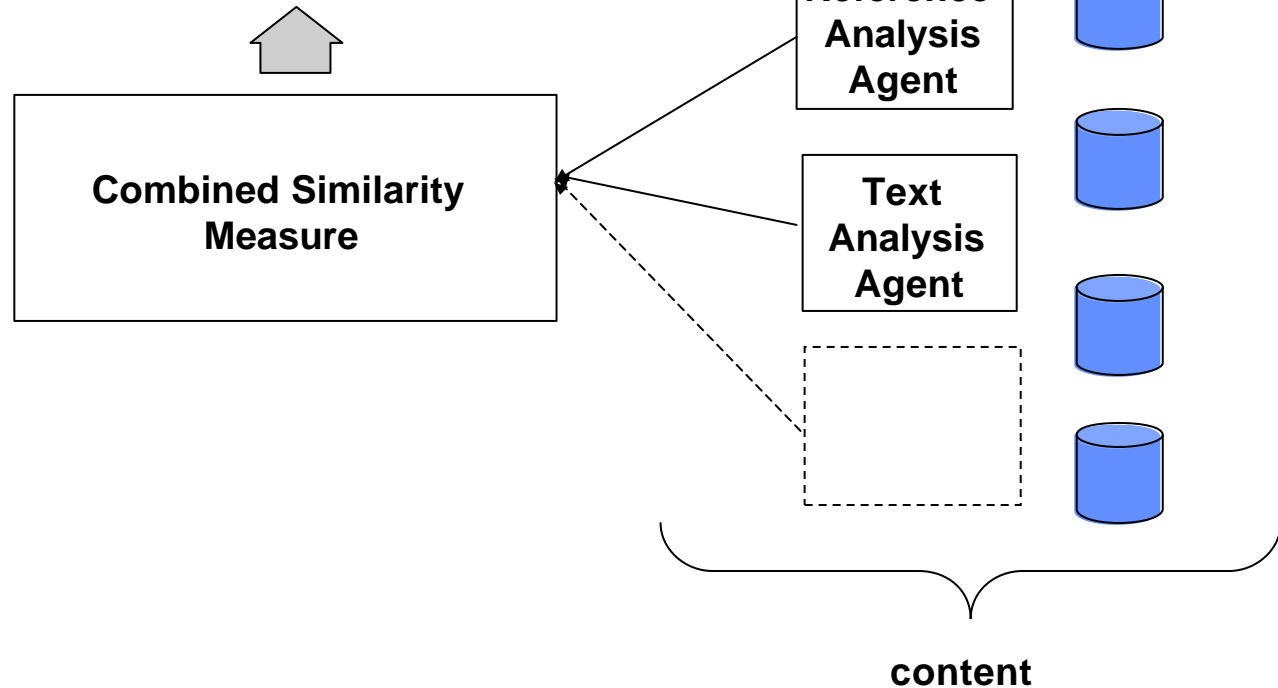

Relationships between documents, topics and users

Content and Context Analysis

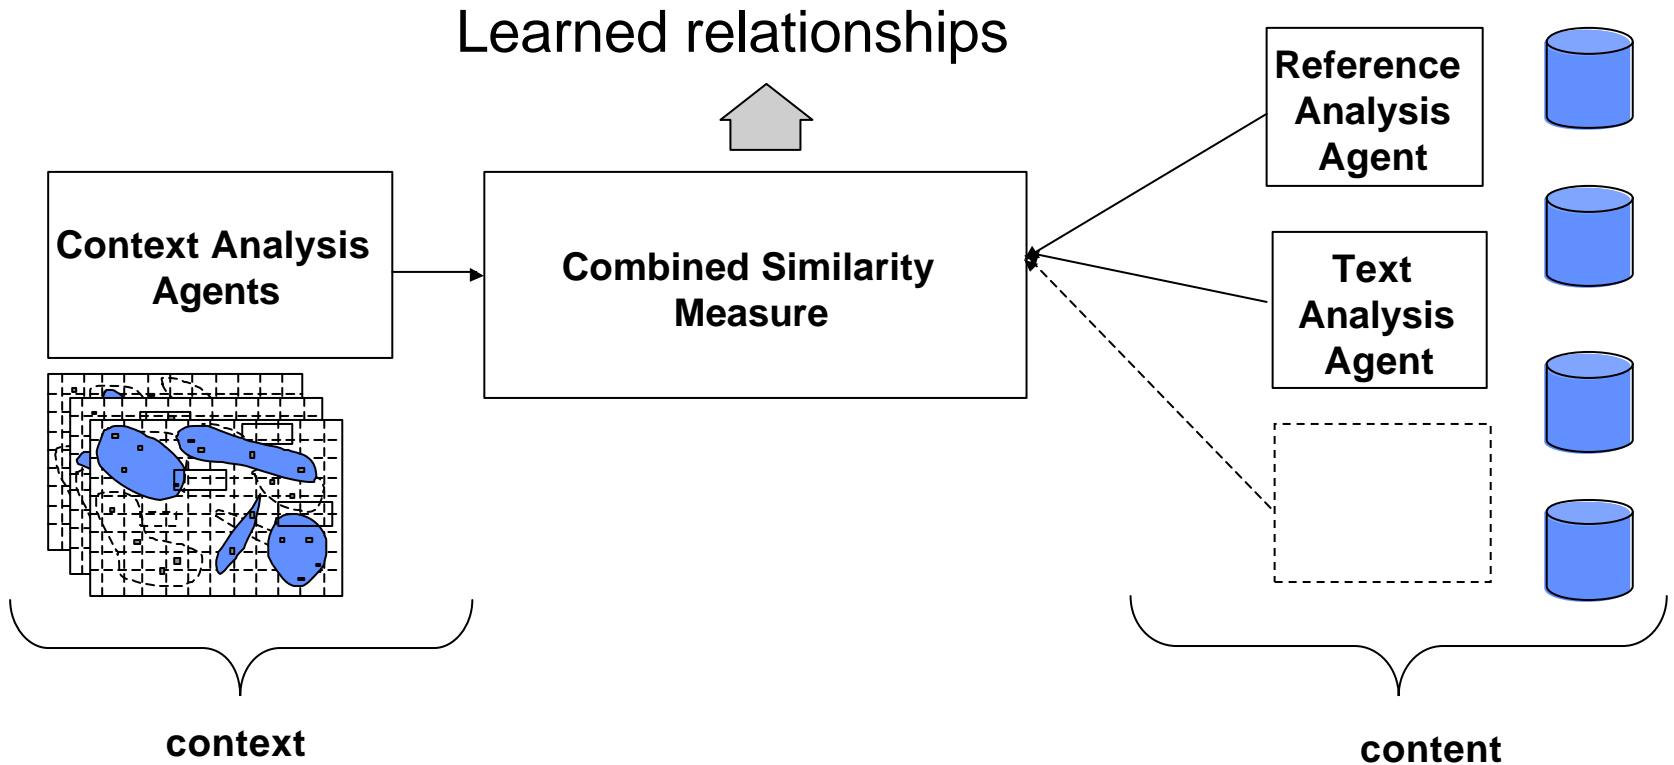

Learning (similarity) relations between documents, topics and users

Learned relationships

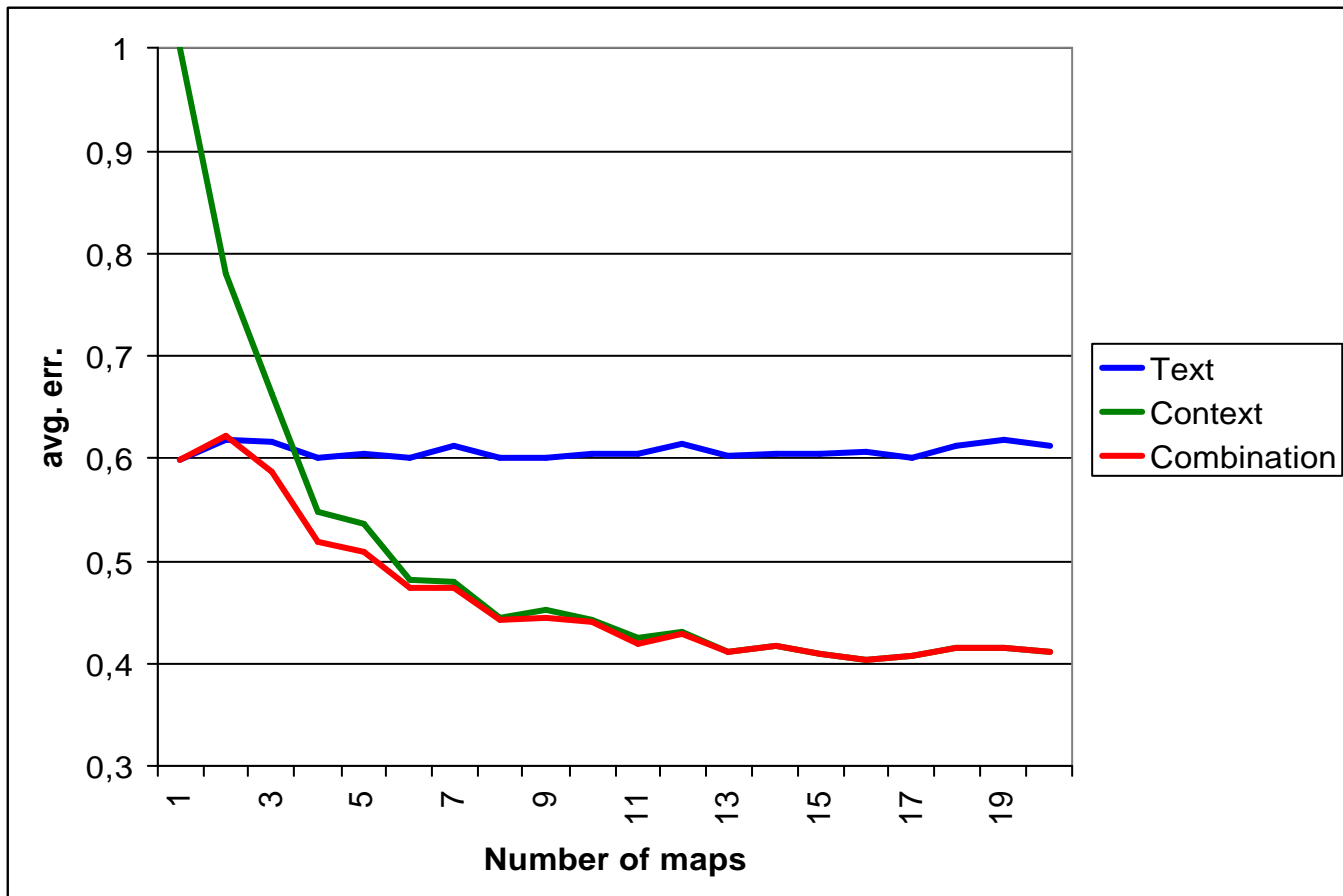

Content and Context Analysis

Learning (similarity) relations between documents, topics and users

Content and Context Analysis

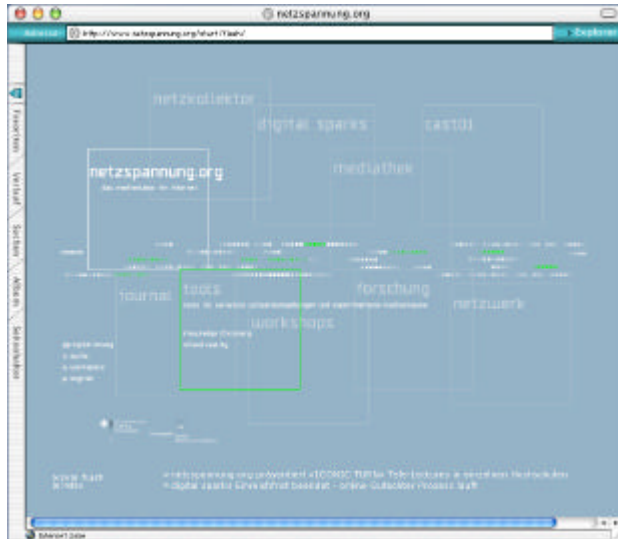

Content and Context Analysis

Some Relevant questions from a Machine Learning Viewpoint

- *Amount of user interaction data* needed to learn the desired concepts?
- *Robustness* of the extracted knowledge against noise or malicious manipulation
- *Local/Global Pattern* (e.g. how are minor opinions reflected in the resulting structures?)

Application Domain

netzspannung.org

- Knowledge portal connecting media art, design and technology
- Collaborative information pool (projects, events...)
- Very heterogeneous content
 - different categorization schemes
 - constantly growing

Summary and Future Work

Summary

- Model and prototype for capturing, visualizing and exchanging knowledge
- Agent technology as software architecture and data integration model
- Machine Learning methods for combining context and content data

Future work

- Evaluation and user testing
 - Improvement of visualization and data analysis methods
 - Support for the Topic Map Format
